

Mr. Pederson,

I have had the opportunity to review results from lab testing in spaces treated with the CleaneAir system. They demonstrate dramatic (almost complete) elimination of many pathogens.

This includes virulent and highly resistant strains of E. Coli, Staphylococcus (MRSA), and VRE (vancomycin-resistant enterococcus). There is marked reduction in virus analog as well.

This system is an excellent means of reducing the presence of pathogens that frequently cause illness and are difficult to treat. This would be especially helpful where there are high concentrations of such organisms such as hospitals, professional buildings, and sports locker rooms.

I also feel comfortable endorsing treatment with CleaneAir having had a personal experience with having my own home treated. When we purchased it there was an overwhelming cigarette smoke odor, and CleaneAir completely eliminated it (making life great for my daughter with many allergies).

Sincerely,

Malik Kutty, MD
